Testing done by team members:

Due to the simplicity of our IOS application we divided the testing into two parts, UI testing and firebase testing. The tests have been carefully selected by our team members to ensure the quality of the user experience and app functionality.

Raphael: Tested Firebase functionality such as forms and data storage by creating a new item in the application and checking if it appears properly in Firebase.

Dara: Tested front end user interface such as user profile view and menu layout by running the application in the XCode simulator and assessing the appearance of the UI.

Yufan: Tested side menu items such as navigation to other view pages by testing each element of the side menu to make sure the application directs users to the correct pages they want.

Lang Li: Tested add-new button that creates a new item entry under the user's profile by adding a dummy test item and checking if it appears in the user profile after creation.
